# TASK 2

Configure yum server

- first mount the device which have the packages and repofiles
- copy the files to a directory
- create a new repofile with new configurations
- list the repo to check the newly created repo is presented
- just install a package (eg: yum install httpd) for checking

baseurl is the path of file
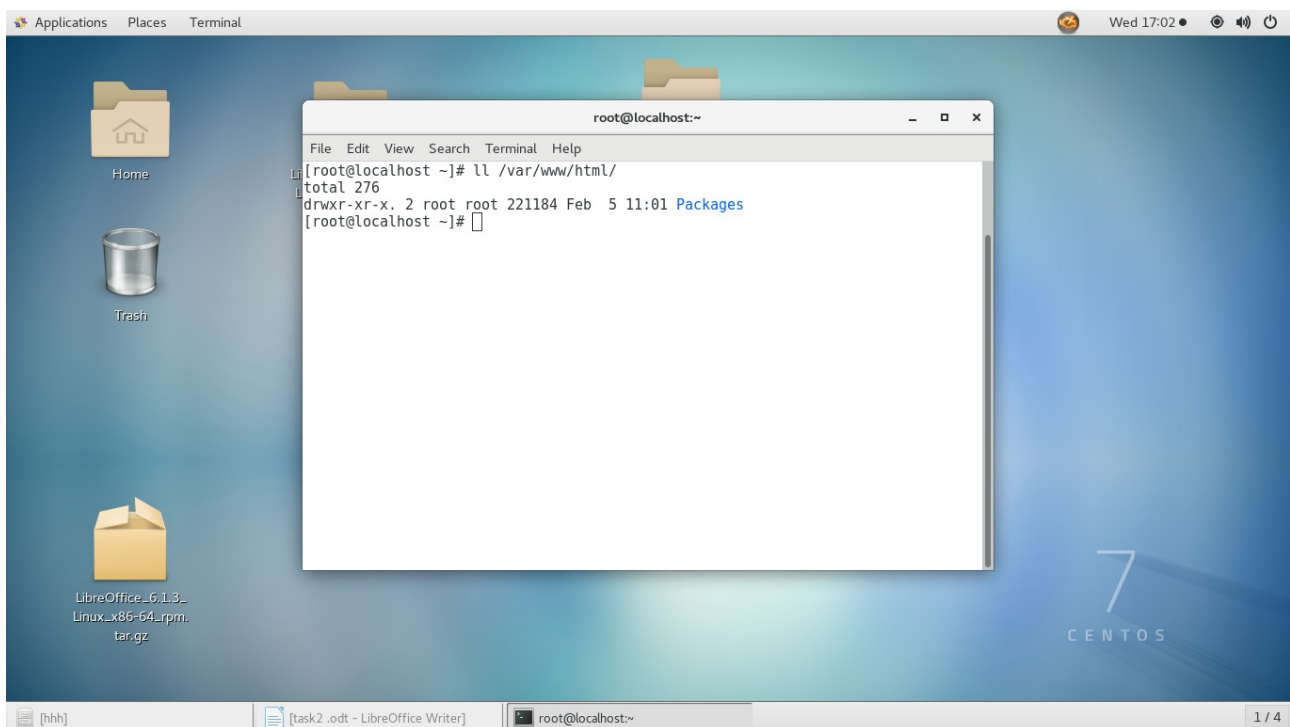

Sharing Packages via http/FTP

for sharing **http**
for the using of the http service the httpd package need to be get installed

#yum install httpd

copy the package to the html directory so that it can be get shared through the http

cp -r "source" "destination"

for the **FTP** sharing

vsftpd is the package which need to get installed
and the packages are being stored in the */va*r/ftp
